

Create a Python virtual environment that contains xESMF package

Step 1: Download “xesmf_env.final.yaml” file from github

Step 2: Open a CUAHSI Jupyterhub terminal

- `conda env create -n xesmf_env --file=xesmf_env.final.yaml`
- `conda activate xesmf_env`

Step 3: Start a new Jupyter Notebook, copy the following code as one line, and execute it

```
!source /opt/conda/bin/activate xesmf_env;  
/home/jovyan/data/conda-envs/xesmf_env/bin/ipython kernel  
install --user --name xesmf_env
```

```
[1]: !source /opt/conda/bin/activate xesmf_env; /home/jovyan/data/conda-envs/xesmf_env/bin/ipython kernel install --user --name xesmf_env  
Installed kernelspec xesmf_env in /home/jovyan/data/.local/share/jupyter/kernels/xesmf_env
```

If you see the message above, **congratulations** and you managed to install the virtual environment in Jupyterhub!
